

COMPUTER VISION AND BIOMETRICS

CHAIR: SCS

Introduction

Computer Vision Computer vision includes methods for acquiring, processing, analysing, and understanding images or image sequences from the real world in order to produce information, e.g., in the forms of decisions. It is the combination of Image Processing and Statistical Pattern Recognition. Biometrics deals with the recognition of persons based on physiological characteristics, such as face, fingerprint, vascular pattern or iris, and behavioural traits, such as gait or speech. It combines Computer Vision with knowledge of human physiology and behaviour.

In SCS we research Computer Vision and Biometrics and their applications in the area of public safety. The research of the group is both fundamental and application oriented; we develop new theoretical concepts, such as new methods for combining classifiers, as well as technology for practical applications. Current research topics are for example face recognition at a distance, intelligent video surveillance, biometrics for border control, finger vein recognition, 3D face modelling and recognition, and forensic biometrics. Our research is embedded in the CTIT institute.

Programme mentor

Dr. ir. L.J. Spreeuwers

Compulsory courses

Code	Course	Study load (EC)
191210910	Image Processing and Computer Vision	5
201100254	Advanced Computer Vision and Pattern Recognition	5
191210900	Introduction to Biometrics	5
192166420	Machine Learning	5
